Objective: Recommendation Letter for Tran Le Minh Khoa

Tran Le Minh Khoa is an intern for Intel Viet Nam from January 2021 to work on the "Baseline shift detection" project. This project employs machine learning algorithms combined with a baseline shift detection method to point out abnormal entities on the production floor by utilizing production data.

As one of the leaders of the project, I interviewed and have been mentoring him. Working closely with him, I find that he is intelligent and has an excellent working attitude. Passing the interview with great results, he demonstrated a deep understanding of machine learning via meaningful ideas on data preprocessing, algorithm selection, and result inference. Moreover, his strong programming skill, especially in Python, has been extremely helpful for only the project but assisting other colleagues. On top of that, he is a quick learner who picks up new tools and software of Intel with ease. With a hard-working attitude, he is always willing to take on all tasks, work overtime, and deliver all the finished products on time.

For the mentioned reasons, I proudly recommend Tran Le Minh Khoa for any university admission or future employment at your institution. He would make an excellent candidate.

You are welcome to contact me from the information above.

Sincerely,

Tran Quang Anh,

Senior Engineer, Intel.
